

ONE-STOP DIGITAL RENTAL MARKETPLACE PLATFORM

Department of **COMPUTER SCIENCE AND ENGINEERING**

ABSTRACT

The ORMA Rental Marketplace System is designed to connect users who want to rent items with those who own them. It provides a platform where users can easily list and browse rental items such as vehicles, electronics, and appliances. The system stores and displays data in real-time, allowing users to access available items quickly. This helps improve accessibility, reduces unnecessary purchases, and promotes efficient resource utilization.

OBJECTIVES

To design and develop a rental marketplace platform that allows users to list and browse items for rent, reducing the difficulty of finding rental services and improving accessibility in an efficient and user-friendly way.

METHODOLOGY

The Rental Marketplace System allows users to register and add items for rent through a web interface. The data is stored in a database and displayed to other users. When a user searches for an item, relevant listings are shown, enabling direct interaction between users.

SYSTEM ARCHITECTURE

RESULT

CONCLUSION

The Rental Marketplace System provides an effective solution for organizing rental services through a digital platform. By allowing users to list and browse items easily, the system reduces manual effort and improves accessibility. The platform supports direct interaction between users and ensures efficient utilization of resources. This project demonstrates a simple and practical approach to solving real-world rental problems.

FUTURE SCOPE

Advanced features like online payment integration, chat system, and review mechanism can be added in the future. Mobile application support and improved filtering options can enhance user experience. These improvements can increase system performance, reduce effort, and support the development of a scalable rental platform while maintaining efficiency and accessibility. Integration of location tracking, notification alerts, secure user verification, and personalized recommendations can further improve usability, reliability, and overall system effectiveness.
